Acknowledgement

Writing this book has been a journey made possible through the support, guidance, and encouragement of many individuals and institutions.

I am deeply thankful to Professor (Dr.) Anand Kishor, PG Department of Botany, Veer Kunwar Singh University, Ara Bihar, my Mother Manju Devi, wife, Mrs. Neelam Kumari my son Prakhar Rudransh & my Daughter Shubhangi Jaya, whose love, patience, and unwavering belief in me gave the strength to persevere through challenges and long hours of writing.

I am equally indebted to librarians, researchers, and staff members who provided access to resources and engaged in thoughtful discussions that enriched my understanding to accomplish this task.

My heartfelt appreciation goes to the editorial team at New Delhi Publishers publication, New Delhi, for their meticulous work and patience.

Abstract

Abiotic stresses, such as excessive salinity or nutrient deficiency, which often result in substantial yield losses, constitute significant challenges to global agriculture. These stresses are particularly detrimental in regions facing poverty, food insecurity and water scarcity. Improving the resilience of crops of high economic and nutritional value such as tomato (*Solanum lycopersicum* L.) to abiotic stresses could offer significant benefits, both economically and in terms of public health. The aim of this thesis is to identify the genetic components of abiotic stress tolerance in tomatoes and to explore the potential of genomic prediction to improve these traits.

In the first chapter, we looked at the genetic architecture of nitrogen deficiency tolerance. We used a comprehensive methodology that integrates QTL mapping with multiparental population, genome-wide association study (GWAS) using a diversity panel, and RNA-seq to identify candidate genes related to nitrogen metabolism. The next two chapters are devoted to the study of salt stress tolerance. We first studied several traits associated with sodium accumulation in various plant organs and developmental stages in a GWAS panel, which enabled us to identify QTLs and a key candidate gene involved in sodium transport within the plant. In addition, we have also studied the impact of salt stress on the root metabolome, characterising metabolites differentially regulated by salt stress and identifying biomarkers of salinity tolerance. QTLs and candidate genes linked to these target metabolites have been identified. In the following two chapters, we engaged GWAS and genomic prediction in multi-environmental analyses using a diversity panel grown under a range of environmental conditions. We have identified interaction QTLs - whose allelic effects vary according to environmental conditions - and compared different GWAS methodologies. Then we have evaluated the effectiveness of various genomic prediction models for improving tolerance to abiotic stress.

Our results revealed several candidate genes that require further experimental validation to elucidate their functional roles and potential applicability in breeding programmes. Preliminary results from genomic prediction models highlight the interest of using these approaches to predict tolerance to abiotic stresses, although further validation in breeding populations is required.

Keywords: Tomato, Genome-Wide Association Studies (GWAS), Genomic Prediction, Abiotic Stress, Salt Stress, Nitrogen Deficiency

Contents

<i>Acknowledgement</i>	v
<i>Abstract</i>	vii
1. Introduction	1
1.1 Overview of Tomato Plant Biology, Origin and Economic Importance	1
1.2 Physiological and Genomic Bases of Abiotic Stress Tolerance	6
1.3 Salt Tolerance	13
1.4 Nitrogen Deficiency	26
1.5 Combined stresses	34
1.6 From QTL Detection to Trait Prediction	37
1.7 Background and Objectives of This Book	46
2. Materials and Methods	49
2.1 Plant Materials	49
2.2 Genotypic Data	50
2.3 Phenotypic Data	54
3. Integration of QTL and Transcriptome Approaches for the Identification of Genes Involved in Tomato Response to Nitrogen Deficiency	59
3.1 Materials and Methods	62
3.2 Results	67
3.3 Discussion	77
3.4 Conclusion	82
4. Characterization of a Major QTL for Above-Ground Sodium Accumulation in Tomato	89
4.1 Materials and Methods	91
4.2 Results	98
4.3 Discussion	111
4.4 Conclusion	114

5. Deciphering Root-Level Salt Tolerance through Metabolomics	117
5.1 Materials and Methods	118
5.2 Results	125
5.3 Discussion	132
5.4 Conclusion	136
6. Mapping Loci Associated with Genotype-Environment Interactions	143
6.1 Materials and Methods	145
6.2 Results	151
6.3 Discussion	160
7. Harnessing G×E Genomic Prediction Models for Improving Abiotic Stress Tolerance	169
7.1 Material and Methods	171
7.2 Results	179
7.3 Discussion	188
7.4 Conclusion	193
8. General Discussion & Perspectives	201
8.1 Strategies to Identify the Genetic Components of Tolerance to Abiotic Stresses	201
8.2 Candidate Gene Validation	208
8.3 Perspectives for Breeding Abiotic Stress Tolerant Tomato Varieties	213
■ References	221
